this publication primarily focuses on the macro and micro rheological behavior of blood and its formed elements on interactions between the formed elements and blood vessel walls and on the microvascular aspects of hemodynamics since many aspects of hemorheology and hemodynamics are affected by disease or clinical states these effects are discussed as are hyperviscosity syndromes therapy for disturbed blood rheology and methods in hemorheology and hemodynamics sections of the handbook include history of hemorheology hemorheology covering basic aspects blood composition blood rheology cell mechanics pathophysiology methods and comparative studies hemodynamics covering basic principles microcirculation in vivo effects endothelium and methods and clinical aspects of hemorheology covering hyperviscosity clinical significance and treatment the goal is to foster greater interchange between workers in the fields so as to promote collaborative efforts and hopefully improved health in selecting topics for this handbook the editors have attempted to provide a general overview of both basic science and clinical hemorheology

and hemodynamics hemorheology and hemodynamics are closely related the former dealing with all aspects of the flow and interactions of the individual blood cells mostly studied in vitro the latter with the in vivo relationships among vessel architecture driving pressure flow rate and shear stress the linkage between the in vitro and in vivo research described in the book will be of interest to both basic science and clinical investigators the editors of the handbook have each been active in the fields of bio and hemorheology for many years and have published extensively they have successfully achieved their objective to publish a well written and well edited handbook that will be valuable for researchers and students in the field

from the perspective of blood flow blood has some unusual properties it is a suspension of blood cells of which the red blood cells are most numerous and are both deformable at moderate and high flow rates and will aggregate under conditions of slow flow also the cellular volume concentration is high about 40-45% these features cause blood to have variable viscosity dependent on flow conditions and cause both red blood cell sedimentation and syneresis effects under slow flow conditions which can lead to rheological artifacts these effects also cause unusual flow phenomena when blood flows in systems of small diameter vessels especially for diameters of about 500 μm or less these phenomena are seen in non uniform cell distributions in vessel cross sections a cell poor layer of mostly blood plasma at vessels walls non proportionate cellular distribution during blood flow through vascular bifurcations which leads to a very wide distribution of vessel cellular concentrations from zero to systemic values in the smaller vessels of the microcirculation etc all these phenomena are discussed in this book as well as the difficulties presented by in vivo microvessels having non ideal geometries table of contents introduction the composition of blood viscometers constitutive equations at last experimental data some in vitro blood flows the fahraeus effect the fahreus lindqvist effect in vitro arterial type bifurcation experimental data in vivo experimental bifurcation data flow in microvascular networks optimization concluding statement references

this series presents reviews covering all aspects of haemodynamics and haemorheology topics covered include the complexities of microcirculation the rheology of blood and blood vessels and the mechanics of blood flow in arteries and veins the contributions aim to reflect the advances being made in experimental techniques and instrumentation for laboratory and clinical measurements and in numerical and mathematical modelling emphasis is placed on the scientific and engineering principles involved but particular attention is also given to the clinical significance of this area of research topics covered by this volume include viscoelastic properties of blood and blood analogues blood flow through narrow tubes and numerical modelling of blood flow

the task the editors have set themselves is to survey the field of clinical hemorheology from basic principles to up to date research it is only in a new science like this that it is possible to span the whole field in a book of this size hemorheology as a new approach to the study and management of a wide range of circulatory diseases is now beginning to appear with increasing frequency in general as well as specialized medical journals hemorheology is also just beginning to creep into the undergraduate medical curriculum therefore the majority of graduate doctors are unequipped to assess the place of hemorheology in the overall framework of circulatory physiology and pathology or to assess its relevance to their everyday practice it is hoped that this book will fill this gap the approach of the book is interdisciplinary the first part deals with basic principles of blood flow circulation and hemorheology it has been written with the general doctor in mind who has no special knowledge of hemodynamics and rheological concepts terminology or methodology to maintain the emphasis on practical clinical applications all the chapters in the second part of the book have been written by clinical specialists practicing in the individual areas of disease the book is so designed that clinicians may be able to read the relevant chapters in the second part of the book in isolation using the basic science aspects contained in the first part of the book as reference chapters

the second conference of the international society of hemorheology took place under the auspices of the university of heidelberg from july 27 august 1 1969 in heidelberg at this conference the name of the society was changed to the international society of biorheology since the members decided to enlarge the scope of the society to include all fields of biorheology meanwhile the society has become an affiliated commission of the international union of pure and applied biophysics the abstracts of the scientific papers as they appeared in the program of the conference have been reprinted in biorheology volume 6 no 4 april 1970 this international journal has become the official organ of our society we are greatly indebted to the honorary chairman professor g quadbeck dean of the university of heidelberg medical school who gave substantial aid to one of us h h h the conference chairman in organizing this international meeting we are grateful to the mayor of the city of heidelberg who welcomed the participants and their families in the cellar of the great barrel of the heidelberger schlob we thank the members of the ladies committee mrs irmgard quadbeck mrs elisabeth hartert and mrs karin kreiter who arranged a most successful social program in heidelberg and the romantic neckar valley
